The invention having been described, I claim

- 1. A motor run-time totalizer, responsive to the rotation of an associated motor, having a rotor, to indicate the amount of time the rotor has been rotating, the apparatus comprising:
 - a) a housing arranged for attachment to the rotor
 - b) a timer, in said housing, that will indicate the total accumulated run time that occurs while it is turned on;
 - c) sensor means, in said housing, to sense the rotation of the rotor and to turn the timer on when the motor is running and turn it off when the motor is not running.
 - 2. The apparatus of claim 1 wherein said timer is a spring powered chronograph.
- 3. The apparatus of claim 1 wherein said sensor means is a pendulum free to rotate about the axis of the rotor, the rotation of the pendulum relative to the rotor axis being sensed to start and stop said timer.
- 4. The apparatus of claim 3 wherein the rotation of the pendulum moves a movement conducting means to start and stop the time accumulation by said timer.
- 5. The apparatus of claim 1 wherein said sensor means is a movable mass arrangement, said mass situated to move away from the rotor axis in response to rotation of said rotor to sense the rotation of said motor.

- 6. The apparatus of claim 1 wherein said motor involves a rotor situated to rotate about an axis which orbits the motor body centerline.
- 7. The apparatus of claim 1 wherein the rotor axis orbits the centerline of said motor, said sensor being a pendulum free to rotate about said axis, power to drive said timer being extracted from the rotation of said pendulum relative to said axis.
- 8. The apparatus of claim 7 wherein said power to drive said timer is delivered to a spring arranged to drive said timer.
- 9. The apparatus of claim 7 wherein said power to drive said timer is delivered to said timer through a slip clutch arranged such that when the pendulum ceases to deliver said power the timer stops running.
- 10. The apparatus of claim 1 wherein said timer is battery powered, said sensor arranged to switch the timer on and off.

- 11. A motor run-time totalizer, responsive to the rotation of an associated progressing cavity positive displacement motor, having a rotor with an axis that orbits the motor centerline, to indicate the amount of time the motor has been rotating, the apparatus comprising:
 - a) a housing with means for attachment to said rotor
 - b) a timer that will indicate the total accumulated run time that occurs while it is turned on;
 - c) sensor means to sense the rotation of the motor by sensing the orbiting of the rotor axis around the motor centerline and to turn the timer on when the motor is running and turn it off when the motor is not running.
- 12. The apparatus of claim 11 wherein said timer is a spring powered chronograph.
- 13. The apparatus of claim 11 wherein said sensor means is a movable mass arrangement, said mass situated to move away from the motor axis in response to rotation of said motor to sense the rotation of said motor.
- 14. The apparatus of claim 12 wherein said power to drive said timer is delivered to a spring arranged to drive said timer.
- 15. The apparatus of claim 12 wherein said power to drive said timer is delivered to said timer through a slip clutch arranged such that when the pendulum ceases to deliver said power the timer stops running.

- 1 16. The apparatus of claim 11 wherein said timer is battery powered, said
- 2 sensor arranged to switch the timer on and off.
